

EMF New Functionality - November 3rd, 2009

Advanced Dataset search/filter capability

EMF now has Advanced search capabilities.

To use this feature click on the *Advanced* button on top right hand section of the screen.

From this; a Search screen appears which allows for additional search criteria:

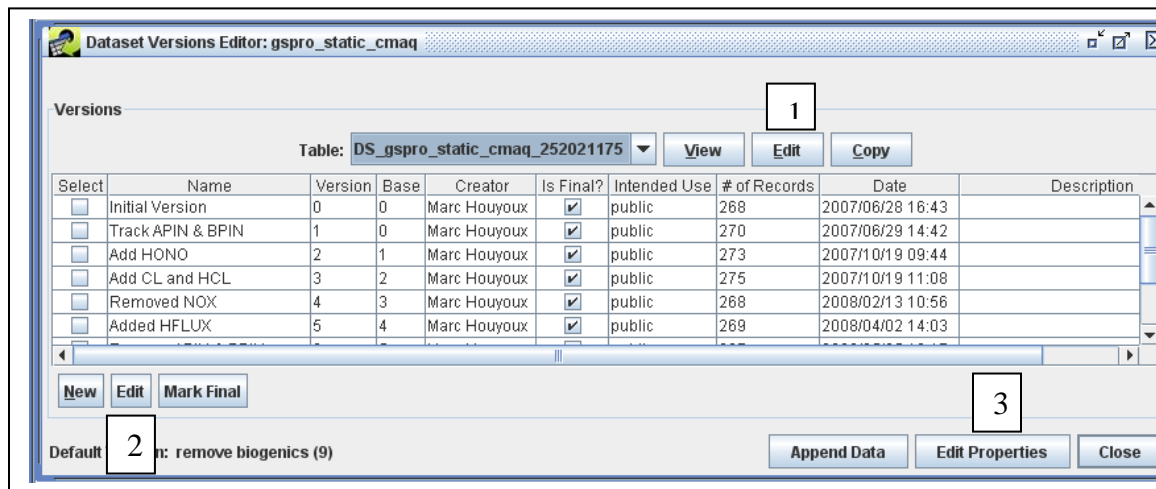

- Name contains: (text)
- Description contains: (text)
- Dataset type: (list selection)
- Keyword: (list selection)
- Keyword: value (text)

The search allows for wildcard (*) searches when entering the values to search for, e.g.: Name contains '2005*tag*'.

NOTE: Once you have chosen the Advanced option the search/filter criteria from the Dataset Manager window is overridden (i.e., the value in the Name contains text field, and the contents of the ‘Show Datasets of Type’ field).

Enhancements to the Dataset Version Editor

The Dataset Version Editor has 3 Edit features

Edit (#1) – Is for Editing the data for the dataset

Edit (#2) – Is for Editing the Dataset’s Version information

Edit Properties (#3) – Is for Editing the Dataset Properties

The Dataset Versions Editor has the following recent enhancements:

1. The addition of a *Description* column which includes tooltips for viewing long version descriptions
2. The addition of a *Intended Use* column which allows dataset versions to be public(full access or read only), group(read/write or read only) or private
3. The Button *Dataset Version Editor* has been renamed to *Edit* (see Edit #2 in screen shot)

NOTE: Same restrictions apply to editing these fields as applied previously to renaming a version. Only the creator of the version, or a user with administrative privileges, can edit these fields for an existing version.
